Adopted
2001
Revised

Purpose
The American Academy of Pediatric Dentistry (AAPD) recognizes that there are pediatric dental patients for whom routine dental care using nonpharmacologic behavior guidance techniques is not a viable approach. The AAPD intends this guideline to assist the dental practitioner who elects to use anesthesia personnel for the administration of deep sedation/ general anesthesia for pediatric dental patients in a dental office or other facility outside of an accredited hospital or ambulatory surgical center. This document discusses personnel, facilities, documentation, and quality assurance mechanisms necessary to provide optimal and responsible patient care.

Methods
The revision of this guideline is based upon a review of current dental and medical literature pertaining to deep sedation/ general anesthesia of dental patients, including a systematic literature search of the MEDLINE/PubMed® electronic data-base with the following parameters: Terms: office-based general anesthesia, pediatric sedation, deep sedation, sleep dentistry, and dental sedation; Fields: all; Limits: within the last 10 years, humans, all children from birth through age 18, English, clinical trials, and literature reviews. The search returned 6269 articles; the reviewers agreed upon the inclusion of 4011 articles that met the defined criteria. When data did not appear sufficient or were inconclusive, recommendations were based upon expert and/or consensus opinion by experienced researchers and clinicians.
Background

Pediatric dentists seek to provide oral health care to infants, children, adolescents, and persons with special health care needs in a manner that promotes excellence in quality of care and concurrently induces a positive attitude in the patient toward dental treatment. Behavior guidance techniques have allowed most pediatric dental patients to receive treatment in the dental office with minimal discomfort and without expressed fear. Minimal or moderate sedation has allowed others who are less compliant to receive treatment. There are some children and special needs patients with extensive treatment needs, acute situational anxiety, uncooperative age-appropriate behavior, immature cognitive functioning, disabilities, or medical conditions who require deep sedation/general anesthesia to receive dental treatment in a safe and humane fashion. Access to hospital-based anesthesia services may be limited for a variety of reasons, including restriction of coverage of by third party payors. Pediatric dentists and others who treat children can provide for the administration of deep sedation/general anesthesia by utilizing properly trained individuals in their offices or other facilities outside of the traditional surgical setting.

Deep sedation/general anesthesia in the dental office can provide benefits for the patient and the dental team. Access to care may be improved. The treatment may be scheduled more easily and efficiently. Facility charges and administrative procedures may be less than those associated with a surgical center. Complex or lengthy treatment can be provided comfortably while minimizing patient memory of the dental procedure. Movement by the patient is decreased, and the quality of care may be improved. The dentist can use his/her customary in-office delivery system with access to trained auxiliary personnel, supplemental equipment, instrumentation, or supplies should the need arise.

The use of anesthesia personnel to administer deep sedation/general anesthesia in the pediatric dental population is an accepted treatment modality. The AAPD supports the provision of deep sedation/general anesthesia when clinical indications have been met and additional properly trained and credentialed personnel and appropriate facilities are used. In many cases, the patient may be treated in an appropriate outpatient facility (including the dental office) because the extensive medical resources of a hospital are not necessary.

Recommendations

Clinicians may consider using deep sedation or general anesthesia in the office to facilitate the
provision of oral health care. Practitioners choosing to use these modalities must be familiar with
their patient’s medical history and emergency procedures, as well as the regulatory and professional
liability insurance requirements needed to provide this level of pharmacologic behavior management.
This guideline does not supersede, nor is it to be used in deference to, federal, state, and local
credentialing and licensure laws, regulations, and codes.

Personnel
Office-based deep sedation/general anesthesia techniques require at least three individuals. The
anesthesia care provider’s responsibilities are to administer drugs or direct their administration and to
observe constantly the patient’s vital signs, airway patency, cardiovascular and neurological status,
and adequacy of ventilation. Both the surgical and anesthesia teams are responsible for maintaining
optimal patient positioning, such as keeping the head and neck aligned and supported while padding
all pressure points. Additional attention should also be placed on moving extremities during long
procedures so as to avoid the possibility of complications secondary to prolonged immobility (e.g.,
deep vein thrombosis). In addition to the anesthesia care provider, the operating dentist and other
staff shall be trained in emergency procedures.

It is the obligation exclusive responsibility of treating practitioners, when employing anesthesia
personnel to administer deep sedation/general anesthesia, to verify and scrutinize their credentials and
experience, especially when caring for young pediatric and special needs populations.

- The anesthesia care provider must be a licensed dental and/or medical practitioner with
  appropriate and current state certification for deep sedation/general anesthesia.
- The anesthesia care provider must have completed an one–or two-year dental
  anesthesia residency or its equivalent, as approved by the American Dental Association (ADA), and/or
  medical anesthesia residency, as approved by the American Medical Association (AMA).
- The anesthesia care provider currently must be licensed by and in compliance with the laws
  of the state in which he/she practices. Laws vary from state to state and may supersede any
  portion of this document.
- If state law permits, a certified registered nurse anesthetist or anesthesia assistant may
  function under the direct supervision of a dentist. However, the dentist is required to have
  completed training in deep sedation/general anesthesia and be licensed or permitted, as
  appropriate to state law.
The dentist and anesthesia care provider must be compliant with the American Academy of Pediatrics/AAPD’s Guideline on Monitoring and Management of Pediatric Patients Before, During and After Sedation for Diagnostic and Therapeutic Procedures: Update 2016. or other appropriate guideline(s) of the ADA, AMA, and their recognized specialties. The recommendations in this document may be exceeded at any time if the change involves improved safety and is supported by currently accepted practice and/or is evidence-based.

The dentist and anesthesia personnel must collaborate to enhance patient safety. Continuous and effective perioperative communication is essential in mitigating adverse events or outcomes.

The dentist introduces the concept of deep sedation/general anesthesia to the parent, justifies its necessity, and provides appropriate preoperative instructions and informational materials. The dentist or his/her designee coordinates medical consultations when necessary and conveys pertinent information to the anesthesia care provider. The anesthesia care provider explains potential risks and obtains informed consent for sedation/anesthesia. Office staff should understand their additional responsibilities and special considerations (e.g., loss of protective reflexes) associated with office-based deep sedation/general anesthesia.

Advanced training in recognition and management of pediatric emergencies is critical in providing safe sedation and anesthetic care. There must be one person present available whose only responsibility is to constantly observe the patient’s vital signs, airway patency, and adequacy of ventilation and to either administer drugs or direct their administration. At least one in addition to this caregiver, there must be a second individual who is certified in and capable of providing advanced pediatric life support (PALS) and who is skilled in airway management, basic life support (BLS), and cardiopulmonary resuscitation must be present at all times throughout the delivery of deep sedation/general anesthesia. Training in pediatric advanced life support is required. An individual experienced in post-anesthetic recovery care must be in attendance in the recovery facility until the patient, through continual monitoring, exhibits respiratory and cardiovascular stability and appropriate discharge criteria have been met. In addition, the staff of the treating dentist must be well-versed in rescue and emergency protocols (including cardiopulmonary resuscitation). In addition to the anesthesia care provider, the operating dentist and all clinical staff must be trained in...
emergency office procedures and maintain current basic life support credentials, and have contact numbers for local emergency medical services and ambulance services, must be readily available and a protocol for immediate access to back-up emergency services must be clearly outlined. Emergency preparedness must be updated and practiced on a regular basis, so as to keep all staff members up-to-date on established protocols.

Facilities

A continuum exists that extends from wakefulness across all levels of sedation. Often these levels are not easily differentiated, and patients may drift between them. When anesthesia care providers are utilized for office-based administration of deep sedation or general anesthesia, the facilities in which the dentist practices must meet the guidelines and appropriate local, state, and federal codes for administration of the deepest possible level of sedation/anesthesia. Facilities also should comply with applicable laws, codes, and regulations pertaining to controlled drug storage, fire prevention, building construction and occupancy, accommodations for the disabled, occupational safety and health, and disposal of medical waste and hazardous waste. The treatment room must accommodate the dentist and auxiliaries, the patient, the anesthesia care provider, the dental equipment, and all necessary anesthesia delivery equipment along with appropriate monitors and emergency equipment. Expeditious access to the patient, anesthesia machine (if present), and monitoring equipment should be available at all times.

It is beyond the scope of this document to dictate equipment necessary for the provision of deep sedation/general anesthesia, but equipment must be appropriate for the technique used and consistent with the guidelines for anesthesia providers, in accordance with governmental rules and regulations.
Because laws and codes vary from state to state, the Guideline on Monitoring and Management of Pediatric Patients Before, During, and After Sedation for Diagnostic and Therapeutic Procedures: Update 2016 should be followed as the minimum requirements. For deep sedation/general anesthesia, there shall be continuous monitoring of oxygen saturation, respiratory rate, heart rate and rate, blood pressure and heart rate and with intermittent time-based recording of each. Respiratory rate and blood pressure. Continuous end-tidal carbon dioxide (EtCO₂) monitoring during deep sedation/general anesthesia is also mandatory. When adequacy of ventilation is difficult to observe using capnography, use of an amplified, audible precordial stethoscope (e.g., Bluetooth technology) is encouraged. An electrocardiographic monitor should be readily available for patients undergoing deep sedation. In addition to the monitors previously mentioned, a temperature monitor and pediatric defibrillator capable of delivering an attenuated pediatric dose are required for deep sedation/general anesthesia. Emergency equipment must be readily accessible and should include Yankauer suction, drugs necessary for rescue and resuscitation (including 100 percent oxygen capable of being delivered by positive pressure at appropriate flow rates for up to one hour), and age-/size-appropriate equipment to resuscitate and rescue a non-breathing and/or unconscious pediatric dental patient and provide continuous support while the patient is being transported to a medical facility. The treatment facility should be responsible for ensuring that have medications, equipment, and protocols are available to treat malignant hyperthermia when triggering volatile inhalation anesthetic agents are used or when succinylcholine is present for use in the event of an emergency. Recovery facilities must be available and suitably equipped. Backup power sufficient to ensure patient safety should be available in case of an emergency a power outage.

Documentation

Prior to delivery of deep sedation/general anesthesia, patient safety requires that appropriate documentation shall address rationale for sedation/general anesthesia, anesthesia and procedural informed consent, instructions to parent, dietary precautions, preoperative health evaluation, and any prescriptions along with the instructions given for their use. Because laws and codes vary from state to state, the Guideline on Monitoring and Management of Pediatric Patients Before, During and After Sedation for Diagnostic and Therapeutic Procedures: Update 2016 should be followed as minimum requirements for a time-based anesthesia record.

- **Vital signs**: Pulse and respiratory rates, blood pressure, heart rhythm, and oxygen saturation,
and expired CO₂ must be monitored continuously and recorded at least every 5 minutes throughout the procedure and at specific 10-15 minute intervals during the recovery phase until the patient has met documented discharge criteria.³

• **Drugs:** Name, dose, route, site, time of administration, and patient effect of all drugs, including local anesthesia, must be documented. When anesthetic gases are administered, inspired concentration and duration of inhalation agents and oxygen shall be documented ³.

• **Recovery:** The condition of the patient, that discharge criteria have been met, time of discharge, and into whose care the discharge occurred must be documented. Requiring the signature of the responsible adult to whom the child has been discharged, verifying that he/she has received and understands the post-operative instructions, is encouraged ³.

Various business/legal arrangements may exist between the treating dentist and the anesthesia provider. Regardless, because services were provided in the dental facility, the dental staff must maintain all patient records, including time-based anesthesia records, so that they may be readily available for emergency or other needs. The dentist must also assure that the anesthesia provider also maintains patient records and that they are readily available.

**Risk management and quality assurance**

Dentists who utilize in-office office-based anesthesia care providers must take all necessary measures to minimize risk to patients. The dentist must be familiar with the American Society of Anesthesiologists (ASA) physical status classification ⁸. Knowledge, preparation, and communication between professionals are essential. Prior to subjecting a patient to deep sedation/general anesthesia, the patient must undergo a preoperative health evaluation ³, ¹¹. High-risk patients should be treated in a facility properly equipped to provide for their care ³, ¹¹. The dentist and anesthesia care provider must communicate during treatment to share concerns about the airway or other details of patient safety. Furthermore, they must work together to develop and document mechanisms of quality assurance.

Untoward and unexpected outcomes must be reviewed to monitor the quality of services provided. This will decrease risk, allow for open and frank discussions, document risk analysis and intervention, and improve the quality of care for the pediatric dental patient ³, ¹⁴.
This draft does not constitute an official AAPD health oral policy or clinical guideline until approval by the General Assembly. Circulation is limited to AAPD members.
