Guideline on Prescribing Dental Radiographs for Infants, Children, Adolescents, and Persons with Special Health Care Needs

Originating Committee
Ad Hoc Committee on Pedodontic Radiology

Review Council
Council on Clinical Affairs

Adopted
1981

Revised

Reaffirmed
1997, 2012

Purpose
The American Academy of Pediatric Dentistry (AAPD) intends this guideline to help practitioners make clinical decisions concerning appropriate selection of dental radiographs as part of an oral evaluation of infants, children, adolescents, and persons with special health care needs. The guideline can be used to optimize patient care, minimize radiation burden, and allocate health care resources responsibly.

Methods
The American Dental Association (ADA) initiated a review of “The Selection of Patients for X-ray Examinations: Dental Radiographic Examinations” in 2002. The AAPD, along with other dental specialty organizations, participated in the review and revision of these guidelines. The Food and Drug Administration (FDA) accepted them in November 2004. This review included a new systematic literature search of the MEDLINE/PubMed electronic database using the following parameters: Terms: “dental radiology”, “dental radiographs”, “dental radiography”, “cone beam computed tomography” AND “guidelines”, “recommendations”; Fields: all fields; Limits: within the last 10 years, humans, and English. In 2006, the ADA Council on Scientific Affairs published an update to their recommendations for dental radiographs. The AAPD continues to endorse the ADA/FDA’s recommendations.

Background
Radiographs are valuable aids in the oral health care of infants, children, adolescents, and persons with special health care needs. They are used to diagnose oral diseases and to monitor dentofacial development and the progress of therapy. The recommendations in the ADA/FDA guidelines were developed to serve as an adjunct to the dentist’s professional judgment. The timing of the initial radiographic examination should not be based upon the patient’s age, but upon each child’s individual circumstances. Because each patient is unique, the need for dental radiographs can be determined only after reviewing the patient’s medical and dental histories, completing a clinical examination, and assessing the patient’s vulnerability to environmental factors that affect oral health.

Radiographs should be taken only when there is an expectation that the diagnostic yield will affect patient care. The AAPD recognizes that there may be clinical circumstances for which a radiograph is indicated, but a diagnostic image cannot be obtained. For example, the patient may be unable to cooperate or the dentist may have privileges in a health care facility lacking intraoral radiographic capabilities. If radiographs of diagnostic quality are unobtainable, the dentist should confer with the parent to determine appropriate management techniques (eg, preventive/restorative interventions, advanced behavior guidance modalities, deferral, referral), giving consideration to the relative risks and benefits of the various treatment options for the patient.

Because the effects of radiation exposure accumulate over time, every effort must be made to minimize the patient’s exposure. Good radiological practices (eg, use of lead apron, thyroid collars, and high-speed film; beam collimation) are important. The dentist must weigh the benefits of obtaining radiographs against the patient’s risk of exposure.

New imaging technologies [ie, cone beam computed tomography (CBCT)] have added 3-dimensional capabilities that have many applications in dentistry. Evidence-based guidelines and policies currently are under development by organizations such as the American Academy of Oral and Maxillofacial Radiology (AAOMR). The usefulness and future of CBCT have been reviewed with an introduction to issues related to criteria, ramifications, and medicolegal considerations. Certain principles clearly are emerging and point to the need for standards of provisions of care. Because this technology has potential to produce vast amounts of data and imaging information beyond initial intentions, it is important to interpret all information obtained, including that which may be beyond the immediate diagnostic needs of the practitioner.

Recommendations
The recommendations of the ADA/FDA guidelines are contained within the accompanying table. “The recommendations in this chart are subject to clinical judgment and may not apply to every patient. They are to be used by dentists only after reviewing the patient’s health history and completing a clinical examination. Because every precaution should be taken to minimize radiation exposure, protective thyroid collars and aprons should be used whenever possible. This practice is strongly recommended for children, women of childbearing age, and pregnant women.”

Although standards are not officially developed for the use of CBCT, this advance in orofacial dental imaging is an excellent adjunct for improvements in dental care. The executive opinion statement of the AAOMR provides initial guidance for the use of this technology. Their recommendations relate to the need for practices of qualified individuals to use this technology with selection criteria which include clear indications that minimize radiation exposure while maximizing diagnostic information obtained. When using CBCT, the resulting imaging is required to be supplemented with a written report placed in the patient’s records that includes full interpretation of the findings.

Patient for monitoring of growth and development

Clinical judgment as to need for and type of radiographic images for evaluation and/or monitoring of dentofacial growth and development

Clinical judgment as to need for and type of radiographic images for evaluation and/or monitoring of dentofacial growth and development. Usually not indicated

Patient with other circumstances including, but not limited to, proposed or existing implants, pathology, restorative/endodontic needs, treated periodontal disease and caries remineralization

Clinical judgment as to need for and type of radiographic images for evaluation and/or monitoring in these circumstances.

* Clinical situations for which radiographs may be indicated include but are not limited to:

A. Positive Historical Findings
   1. Previous periodontal or endodontic treatment
   2. History of pain or trauma
   3. Familial history of dental anomalies
   4. Postoperative evaluation of healing
   5. Remineralization monitoring
   6. Presence of implants or evaluation for implant placement

B. Positive Clinical Signs/Symptoms
   1. Clinical evidence of periodontal disease
   2. Large or deep restorations
   3. Deep carious lesions
   4. Malposed or clinically impacted teeth
   5. Swelling
   6. Evidence of dental/facial trauma
   7. Mobility of teeth
   8. Sinus tract ("fistula")
   9. Clinically suspected sinus pathology
   10. Growth abnormalities
   11. Oral involvement in known or suspected systemic disease
   12. Positive neurologic findings in the head and neck
   13. Evidence of foreign objects
   14. Pain and/or dysfunction of the temporomandibular joint
   15. Facial asymmetry
   16. Abutment teeth for fixed or removable partial prosthesis
   17. Unexplained bleeding
   18. Unexplained sensitivity of teeth
   19. Unusual eruption, spacing or migration of teeth
   20. Unusual tooth morphology, calcification or color
   21. Unexplained absence of teeth
   22. Clinical erosion

** Factors increasing risk for caries may include but are not limited to:

1. High level of caries experience or demineralization
2. History of recurrent caries
3. High titers of cariogenic bacteria
4. Existing restoration(s) of poor quality
5. Poor oral hygiene
6. Inadequate fluoride exposure
7. Prolonged nursing (bottle or breast)
8. Frequent high sucrose content in diet
9. Poor family dental health
10. Developmental or acquired enamel defects
11. Developmental or acquired disability
12. Xerostomia
13. Genetic abnormality of teeth
14. Many multisurface restorations
15. Chemo/radiation therapy
16. Eating disorders
17. Drug/alcohol abuse
18. Irregular dental care
